src.view.View	27

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

src.controller.BoardManager	A library containing useful functions for manipulating BoardT objects	9
src.model.BoardT	An ADT that implements the board for the 2048 game using a matrix (2-dimensional array) of integer values to represent the state of the board	11
src.view.BoardUI	An abstract object to display and update the view of the current state of the 2048 game board from the Controller module	14
src.view.ComponentUI	An interface for UI components	16
src.controller.Controller	An abstract object that represents a controller used to make moves and check the state of the 2048 game	16
src.Demo	A library containing a single method for assembling the model, view and controller modules and launching the playable 2048 application. Please comment/ uncomment one of the two sections in the main method to either start a new game or restore a previous game	19
src.model.DirectionT	An enumerated type that represents the direction of a given move in the game (i.e. the arrow key directions)	20
src.view.MessageUI	An abstract object to display and update the view of the current state the 2048 game from the Controller module with respect to whether the player has achieved the 2048 tile or if the game is over	21
src.model.ScoreT	An abstract object that maintains the score and high score of the game	22
src.view.ScoreUI	An abstract object to display and update the view of the current score and high score of the 2048 game from the ScoreT module	24
src.view.TileUI	An abstract data type to display and update the view of an individual tile in the 2048 game board	25
src.view.View	An abstract object for displaying the the 2048 game using a graphical user interface (GUI) . . .	27

Chapter 4

Namespace Documentation

4.1 Package src.controller

Classes

- class [BoardManager](#)
A library containing useful functions for manipulating BoardT objects.
- class [Controller](#)
An abstract object that represents a controller used to make moves and check the state of the 2048 game.

4.1.1 Detailed Description

Author: Saruggan Thiruchelvan (thirus6) Revised: April 10, 2021

Description: [BoardManager](#) Module (Library)

Author: Saruggan Thiruchelvan (thirus6) Revised: April 11, 2021

Description: [Controller](#) Module (Abstract Object)

4.2 Package src.model

Classes

- enum [DirectionT](#)
An enumerated type that represents the direction of a given move in the game (i.e. the arrow key directions).
- class [BoardT](#)
An ADT that implements the board for the 2048 game using a matrix (2-dimensional array) of integer values to represent the state of the board.
- class [ScoreT](#)
An abstract object that maintains the score and high score of the game.

4.2.1 Detailed Description

Author: Saruggan Thiruchelvan (thirus6) Revised: April 10, 2021

Description: [DirectionT](#) Module (Enumerated Type)

Author: Saruggan Thiruchelvan (thirus6) Revised: April 10, 2021

Author: Saruggan Thiruchelvan (thirus6) Revised: April 10, 2021

Description: [ScoreT](#) Module (Abstract Object)

4.3 Package src.view

Classes

- class [View](#)
An abstract object for displaying the the 2048 game using a graphical user interface (GUI).
- class [BoardUI](#)
An abstract object to display and update the view of the current state of the 2048 game board from the Controller module.
- interface [ComponentUI](#)
An interface for UI components.
- class [MessageUI](#)
An abstract object to display and update the view of the current state the 2048 game from the Controller module with respect to whether the player has achieved the 2048 tile or if the game is over.
- class [ScoreUI](#)
An abstract object to display and update the view of the current score and high score of the 2048 game from the ScoreT module.
- class [TileUI](#)
An abstract data type to display and update the view of an individual tile in the 2048 game board.

4.3.1 Detailed Description

Author: Saruggan Thiruchelvan (thirus6) Revised: April 11, 2021

Description: [View](#) Module (Abstract Object)

Author: Saruggan Thiruchelvan (thirus6) Revised: April 11, 2021

Description: [BoardUI](#) Module (Abstract Data Type)

Description: [ScoreUI](#) Module (Abstract Data Type)

Author: Saruggan Thiruchelvan (thirus6) Revised: April 11, 2021

Description: [TileUI](#) Module (Abstract Data Type)

Chapter 5

Class Documentation

5.1 src.controller.BoardManager Class Reference

A library containing useful functions for manipulating BoardT objects.

Static Public Member Functions

- static [BoardT merge](#) ([BoardT](#) board, [DirectionT](#) direction)
Return a new BoardT object such that for every pair of duplicate tiles, the value of the tile in "front" is doubled and the value of the tile "behind" is set to 0 (i.e empty).
- static int [scoreFromMerge](#) ([BoardT](#) board, [DirectionT](#) direction)
Calculate the points accumulated from merging the given board in the given direction.
- static [BoardT align](#) ([BoardT](#) board, [DirectionT](#) direction)
Return a new BoardT object such that the every tile in the board is aligned in the given direction.
- static [BoardT addRandomTile](#) ([BoardT](#) board)
Return a copy of the given BoardT object with a random tile added to a random empty position of the board.

5.1.1 Detailed Description

A library containing useful functions for manipulating BoardT objects.

Note: All methods do not change the state of the BoardT object passed in. Instead, a new BoardT object is returned.

5.1.2 Member Function Documentation

5.1.2.1 addRandomTile()

```
static BoardT src.controller.BoardManager.addRandomTile (  
    BoardT board ) [static]
```

Return a copy of the given BoardT object with a random tile added to a random empty position of the board.

Note: The probability of the value of the random tile is 90% chance of a 2 and 10% chance of a 4.

Parameters

<i>board</i>	The board to add a random tile to.
--------------	------------------------------------

Returns

A new BoardT object with a random tile added to a random position of the given board.

Exceptions

<i>IllegalStateException</i>	If the given board is full.
------------------------------	-----------------------------

5.1.2.2 align()

```
static BoardT src.controller.BoardManager.align (  
    BoardT board,  
    DirectionT direction ) [static]
```

Return a new BoardT object such that the every tile in the board is aligned in the given direction.

Parameters

<i>board</i>	The board to be aligned in the given direction.
<i>direction</i>	The direction that the board is being aligned in.

Returns

A new BoardT object representing the board aligned in the given direction.

5.1.2.3 merge()

```
static BoardT src.controller.BoardManager.merge (  
    BoardT board,  
    DirectionT direction ) [static]
```

Return a new BoardT object such that for every pair of duplicate tiles, the value of the tile in "front" is doubled and the value of the tile "behind" is set to 0 (i.e empty).

Parameters

<i>board</i>	The board to be merged in the given direction.
<i>direction</i>	The direction that the board is being merged in.

Returns

A new BoardT object representing the board merged in the given direction.

5.1.2.4 scoreFromMerge()

```
static int src.controller.BoardManager.scoreFromMerge (
    BoardT board,
    DirectionT direction ) [static]
```

Calculate the points accumulated from merging the given board in the given direction.

For every pair of duplicate tiles, the amount of points accumulated is equal to sum of the value of both tiles (or double the value of the tile).

Parameters

<i>board</i>	The board to be merged in the given direction.
<i>direction</i>	The direction that the board is being merged in.

Returns

The number of points accumulated from merging the given board in the given direction.

The documentation for this class was generated from the following file:

- src/controller/BoardManager.java

5.2 src.model.BoardT Class Reference

An ADT that implements the board for the 2048 game using a matrix (2-dimensional array) of integer values to represent the state of the board.

Public Member Functions

- **BoardT ()**
Initializes a BoardT object with all tiles set to 0 (i.e. empty).
- **int getTile (int i, int j)**
Get the value stored at the tile at position i, j of the board.
- **void setTile (int i, int j, int value)**
Set the value to be stored at the tile at position i, j of the board.
- **boolean isTileEmpty (int i, int j)**
Check if the value stored at the tile at position i, j of the board is 0 (i.e. empty).
- **boolean isFull ()**
Check if the board is full.
- **boolean equals (BoardT other)**
Check if board is equal to another given board.
- **BoardT copy ()**
Make and return a copy of the current BoardT object.

Public Attributes

- final int `SIZE` = 4
The width/height of the board.

5.2.1 Detailed Description

An ADT that implements the board for the 2048 game using a matrix (2-dimensional array) of integer values to represent the state of the board.

Assume the top-left position of the board is $(i, j) = (0, 0)$ and assume the bottom-right position of the board is $(i, j) = (SIZE-1, SIZE-1)$.

5.2.2 Member Function Documentation

5.2.2.1 `copy()`

```
BoardT src.model.BoardT.copy ( )
```

Make and return a copy of the current `BoardT` object.

Returns

A `BoardT` object that is equal to the current `BoardT` object

5.2.2.2 `equals()`

```
boolean src.model.BoardT.equals (
    BoardT other )
```

Check if board is equal to another given board.

Parameters

<i>other</i>	The board to compare equivalence with.
--------------	--

Returns

True if every tile in the board has the same value as every tile in other board.

5.2.2.3 getTile()

```
int src.model.BoardT.getTile (
    int i,
    int j )
```

Get the value stored at the tile at position i, j of the board.

Parameters

<i>i</i>	The horizontal index of the tile.
<i>j</i>	The vertical index of the tile.

Returns

The value stored in the tile at position i, j of the board.

Exceptions

<i>IndexOutOfBoundsException</i>	If the value of i or j is not within the bounds of [0, SIZE).
----------------------------------	---

5.2.2.4 isFull()

```
boolean src.model.BoardT.isFull ( )
```

Check if the board is full.

Returns

True if none of the tiles in the board are empty.

5.2.2.5 isTileEmpty()

```
boolean src.model.BoardT.isTileEmpty (
    int i,
    int j )
```

Check if the value stored at the tile at position i, j of the board is 0 (i.e. empty).

Parameters

<i>i</i>	The horizontal index of the tile.
<i>j</i>	The vertical index of the tile.

Returns

True if the value of the tile is 0.

Exceptions

<i>IndexOutOfBoundsException</i>	If the value of <i>i</i> or <i>j</i> is not within the bounds of [0, SIZE).
----------------------------------	---

5.2.2.6 setTile()

```
void src.model.BoardT.setTile (
    int i,
    int j,
    int value )
```

Set the value to be stored at the tile at position *i*, *j* of the board.

Parameters

<i>i</i>	The horizontal index of the tile.
<i>j</i>	The vertical index of the tile.
<i>value</i>	The value to be stored in the tile at position <i>i</i> , <i>j</i> of the board.

Exceptions

<i>IndexOutOfBoundsException</i>	If the value of <i>i</i> or <i>j</i> is not within the bounds of [0, SIZE).
----------------------------------	---

The documentation for this class was generated from the following file:

- src/model/BoardT.java

5.3 src.view.BoardUI Class Reference

An abstract object to display and update the view of the current state of the 2048 game board from the Controller module.

Inheritance diagram for src.view.BoardUI:

Collaboration diagram for src.view.BoardUI:

Public Member Functions

- [BoardUI](#) ()
Initialize and setup the look of the JPanel as well as access the current BoardT instance from the Controller module to initialize the matrix (2-dimensional array) of [TileUI](#) components.
- void [update](#) ()
Access the current BoardT instance from the Controller module and set/update each [TileUI](#) component.

5.3.1 Detailed Description

An abstract object to display and update the view of the current state of the 2048 game board from the Controller module.

This module extends the Java Swing `JPanel` class and implements the [ComponentUI](#) interface. The `BoardT` instance is accessed directly from the Controller module and displayed in a grid layout using [TileUI](#) components.

The documentation for this class was generated from the following file:

- `src/view/BoardUI.java`

5.4 src.view.ComponentUI Interface Reference

An interface for UI components.

Inheritance diagram for src.view.ComponentUI:

Public Member Functions

- void [update](#) ()

The update method contains logic and functionality for updating the state of the UI component as well as updating the look of the UI component to reflect the changes.

5.4.1 Detailed Description

An interface for UI components.

UI components are modules that extend a Java Swing JComponent class that need to be updated regularly and/or have values that change with each move in the 2048 game. UI component modules have the suffix "UI" in their names.

The documentation for this interface was generated from the following file:

- src/view/ComponentUI.java

5.5 src.controller.Controller Class Reference

An abstract object that represents a controller used to make moves and check the state of the 2048 game.

Static Public Member Functions

- static void [newGame](#) ()
Reset the board, add two random tiles and reset the score.
- static void [resumeGame](#) ([BoardT](#) resumeBoard, int initialScore, int initialHighScore)
Resume a previous/existing game given a board, score and high score.
- static void [move](#) ([DirectionT](#) direction)
Make a move in the game in the given direction.
- static boolean [canMove](#) ([DirectionT](#) direction)
Check if a move in the given direction changes the board.
- static boolean [isGameOver](#) ()
Check if the game is over.
- static int [nextTileToGet](#) ()
Get the next highest tile to be achieved in the game.
- static [BoardT](#) [getBoard](#) ()
Return a copy of the current board.

5.5.1 Detailed Description

An abstract object that represents a controller used to make moves and check the state of the 2048 game.

The state of the board is stored in a BoardT object and the score is maintained using the ScoreT module. Either newGame or resumeGame is called before using the controller.

5.5.2 Member Function Documentation

5.5.2.1 canMove()

```
static boolean src.controller.Controller.canMove (
    DirectionT direction ) [static]
```

Check if a move in the given direction changes the board.

Parameters

<i>direction</i>	The direction to be moved in.
------------------	-------------------------------

Returns

True if the board resulting from making a move in the given direction is not equal to the board prior to the move.

See also

[move](#)

5.5.2.2 getBoard()

```
static BoardT src.controller.Controller.getBoard ( ) [static]
```

Return a copy of the current board.

Returns

A BoardT object equal to the current board.

5.5.2.3 isGameOver()

```
static boolean src.controller.Controller.isGameOver ( ) [static]
```

Check if the game is over.

Returns

True if one cannot move in all four directions.

5.5.2.4 move()

```
static void src.controller.Controller.move (
    DirectionT direction ) [static]
```

Make a move in the game in the given direction.

Assuming canMove is true, the board is aligned, merged and aligned in the given direction and the score is updated accordingly (using the ScoreT module).

Parameters

<i>direction</i>	The direction to be moved in.
------------------	-------------------------------

Exceptions

<i>IllegalStateException</i>	If the game is over.
------------------------------	----------------------

See also

[canMove](#)
[isGameOver](#)

5.5.2.5 nextTileToGet()

```
static int src.controller.Controller.nextTileToGet ( ) [static]
```

Get the next highest tile to be achieved in the game.

At the start of a new game, the next tile to be achieved is 2048. After the 2048 tile is achieved then the next tile is 4096, then 8192, etc.

Returns

The value of the next highest tile to be achieved in the game.

5.5.2.6 resumeGame()

```
static void src.controller.Controller.resumeGame (
    BoardT resumeBoard,
    int initialScore,
    int initialHighScore ) [static]
```

Resume a previous/existing game given a board, score and high score.

This is to be used to restore the state of the game and continue to play.

Parameters

<i>resumeBoard</i>	The board to resume/continue the game from.
<i>initialScore</i>	The current score to resume/continue the game from (initialized using the ScoreT module).
<i>initialHighScore</i>	The high score to resume/continue the game from (initialized using the ScoreT module).

Exceptions

<i>IllegalArgumentException</i>	If the initial score or initial high score is less than 0 or if the initial high score is less than the initial score.
---------------------------------	--

The documentation for this class was generated from the following file:

- src/controller/Controller.java

5.6 src.Demo Class Reference

A library containing a single method for assembling the model, view and controller modules and launching the playable 2048 application. Please comment/ uncomment one of the two sections in the main method to either start a new game or restore a previous game.

Static Public Member Functions

- static void `main` (String[] args)
Initialize the model, view and controller objects, and launch the application.

5.6.1 Detailed Description

A library containing a single method for assembling the model, view and controller modules and launching the playable 2048 application. Please comment/ uncomment one of the two sections in the main method to either start a new game or restore a previous game.

5.6.2 Member Function Documentation

5.6.2.1 main()

```
static void src.Demo.main (
    String[] args ) [static]
```

Initialize the model, view and controller objects, and launch the application.

Choose to either initialize a new game of 2048 or resume/continue a previous game based on a user-defined configuration of the board (must explicitly comment/uncomment selection).

Parameters

<i>args</i>	
-------------	--

1) Initialize and display a new game of 2048.

2) Resume/restore a previous game of 2048.

The documentation for this class was generated from the following file:

- src/Demo.java

5.7 src.model.DirectionT Enum Reference

An enumerated type that represents the direction of a given move in the game (i.e. the arrow key directions).

Public Attributes

- LEFT
- RIGHT
- UP
- DOWN

5.7.1 Detailed Description

An enumerated type that represents the direction of a given move in the game (i.e. the arrow key directions).

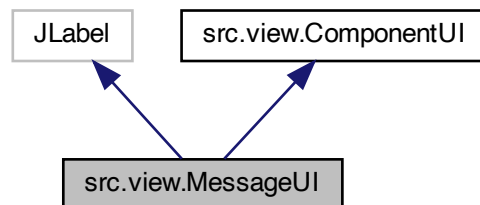

The documentation for this enum was generated from the following file:

- src/model/DirectionT.java

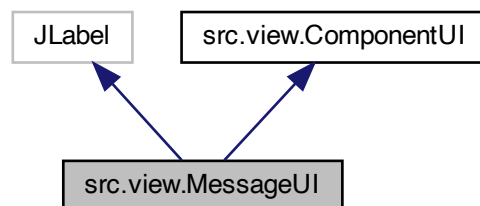

5.8 src.view.MessageUI Class Reference

An abstract object to display and update the view of the current state the 2048 game from the Controller module with respect to whether the player has achieved the 2048 tile or if the game is over.

Inheritance diagram for src.view.MessageUI:

Collaboration diagram for src.view.MessageUI:

Public Member Functions

- [MessageUI](#) ()
Initialize and setup the look of the JLabel as well as access the current state of the game from the Controller module to set the text accordingly.
- void [update](#) ()
Access the current state of the game from the Controller module and update the text accordingly.

5.8.1 Detailed Description

An abstract object to display and update the view of the current state the 2048 game from the Controller module with respect to whether the player has achieved the 2048 tile or if the game is over.

This module extends Java Swing JLabel class and implements the [ComponentUI](#) interface. The state of the game is accessed directly from the Controller module and displays it alongside basic instructions for the game.

5.8.2 Member Function Documentation

5.8.2.1 update()

```
void src.view.MessageUI.update ( )
```

Access the current state of the game from the Controller module and update the text accordingly.

The message displayed varies according to the state of the game. If the game is over, it prompts the player to start a new game or exit. Else, it prompts the player to use the arrow keys to make a move to get the 2048 tile. If the 2048 tile has been achieved, it displays the next tile to get.

Implements [src.view.ComponentUI](#).

The documentation for this class was generated from the following file:

- [src/view/MessageUI.java](#)

5.9 src.model.ScoreT Class Reference

An abstract object that maintains the score and high score of the game.

Static Public Member Functions

- static void [initialize](#) (int initialScore, int initialHighScore)
Initialize the score and high score of the game.
- static void [updateScore](#) (int points)
Add the given number of points to the current score and update the high score if necessary.
- static int [getScore](#) ()
Get the value of the current score of the game.
- static int [getHighScore](#) ()
Get the value of the current high score of the game.
- static void [resetScore](#) ()
Reset the current score of the game back to 0.

5.9.1 Detailed Description

An abstract object that maintains the score and high score of the game.

5.9.2 Member Function Documentation

5.9.2.1 getHighScore()

```
static int src.model.ScoreT.getHighScore ( ) [static]
```

Get the value of the current high score of the game.

Returns

The current high score of the game.

5.9.2.2 getScore()

```
static int src.model.ScoreT.getScore ( ) [static]
```

Get the value of the current score of the game.

Returns

The current score of the game.

5.9.2.3 initialize()

```
static void src.model.ScoreT.initialize (
    int initialScore,
    int initialHighScore ) [static]
```

Initialize the score and high score of the game.

By default, the score and high score are set to 0 but this is used for purposes of resuming a previous game.

Parameters

<i>initialScore</i>	The initial score of the game.
<i>initialHighScore</i>	The initial high score of the game.

Exceptions

<i>IllegalArgumentException</i>	If the initial score or initial high score is less than 0 or if the initial high score is less than the initial score.
---------------------------------	--

5.9.2.4 updateScore()

```
static void src.model.ScoreT.updateScore (
```

```
int points ) [static]
```

Add the given number of points to the current score and update the high score if necessary.

Parameters

<i>points</i>	The number of points to be added to current score.
---------------	--

Exceptions

<i>IllegalArgumentException</i>	If number of points being added is less than 0.
---------------------------------	---

The documentation for this class was generated from the following file:

- src/model/ScoreT.java

5.10 src.view.ScoreUI Class Reference

An abstract object to display and update the view of the current score and high score of the 2048 game from the ScoreT module.

Inheritance diagram for src.view.ScoreUI:

Collaboration diagram for src.view.ScoreUI:

Public Member Functions

- [ScoreUI](#) ()
Initialize and setup the look of the JPanel as well as access the score/high score from the ScoreT module to display it using two JLabels.
- void [update](#) ()
Access the current score/high score from the ScoreT module and update the text of the two JLabels.

5.10.1 Detailed Description

An abstract object to display and update the view of the current score and high score of the 2048 game from the ScoreT module.

This module extends Java Swing JPanel class and implements the [ComponentUI](#) interface. The score and high score are displayed using two JLabels and their values are accessed directly from the ScoreT module.

The documentation for this class was generated from the following file:

- src/view/ScoreUI.java

5.11 src.view.TileUI Class Reference

An abstract data type to display and update the view of an individual tile in the 2048 game board.

Inheritance diagram for src.view.TileUI:

Collaboration diagram for src.view.TileUI:

Public Member Functions

- [TileUI](#) (int initialValue)
Initialize and setup the look of the JLabel as well as set its value and consequently its background color, foreground color and text accordingly.
- void [setValue](#) (int newValue)
Set the current value of the tile. If the tile is "empty", its value is set to 0.
- void [update](#) ()
Set the background color, foreground color, and text of the JLabel according to the current value of the tile.

5.11.1 Detailed Description

An abstract data type to display and update the view of an individual tile in the 2048 game board.

This module extends the Java Swing JLabel class and implements the [ComponentUI](#) interface. The value of the tile is set (by the BoardT module) and the background color, foreground color, and text is updated accordingly to resemble the look of the tiles in original 2048 game. If the tile is "empty", its value is set to 0. Assume that the value of the tile is always positive and never greater than 4 digits in length.

5.11.2 Constructor & Destructor Documentation

5.11.2.1 TileUI()

```
src.view.TileUI.TileUI (
    int initialValue )
```

Initialize and setup the look of the JLabel as well as set its value and consequently its background color, foreground color and text accordingly.

Parameters

<i>initialValue</i>	The initial value of the tile. If the tile is "empty", the initial value is set to 0.
---------------------	---

5.11.3 Member Function Documentation

5.11.3.1 setValue()

```
void src.view.TileUI.setValue (
    int newValue )
```

Set the current value of the tile. If the tile is "empty", its value is set to 0.

Parameters

<i>newValue</i>	The value to set the tile to.
-----------------	-------------------------------

The documentation for this class was generated from the following file:

- src/view/TileUI.java

5.12 src.view.View Class Reference

An abstract object for displaying the the 2048 game using a graphical user interface (GUI).

Inheritance diagram for src.view.View:

Collaboration diagram for src.view.View:

Public Member Functions

- void **keyPressed** (KeyEvent e)
- void **keyTyped** (KeyEvent e)
- void **keyReleased** (KeyEvent e)
- void **actionPerformed** (ActionEvent e)

Static Public Member Functions

- static void [display](#) ()
Initialize and display the GUI window.

5.12.1 Detailed Description

An abstract object for displaying the the 2048 game using a graphical user interface (GUI).

This module makes use of the Java Swing toolkit to generate GUI components and the Java AWT Event package to handle user interactions. The [View](#) module is represented by a host of UI component modules (that are updated regularly) such as [BoardUI](#), [ScoreUI](#), and [MessageUI](#) and some non-UI components such as a JFrame for the window and a JLabel for the title among others.

5.12.2 Member Function Documentation

5.12.2.1 [display\(\)](#)

```
static void src.view.View.display ( ) [static]
```

Initialize and display the GUI window.

Assume this method is called after initializing the 2048 game using either `newGame` or `resumeGame` in the Controller module. A Java Swing JFrame acts a GUI window to display and update the [BoardUI](#), [ScoreUI](#), and [MessageUI](#) modules among other non-UI components.

The documentation for this class was generated from the following file:

- `src/view/View.java`
